

中南大学

2003年研究生入学考试试题

考试科目: 电路理论

考试科目代码: 440

注意: 所有答案(含选择题、填空题、判断题、作图题等)一律答在中南大学答题纸上; 写在试题纸上或其他地点一律不给分。作图题可以在原试题图上作答, 然后将“图”撕下来贴在答题纸上相应位置。

一、计算下列各题(每小题 8 分, 共 32 分)

1-1 试求图 1-1 所示电路的输入电阻 R_{ab} 。

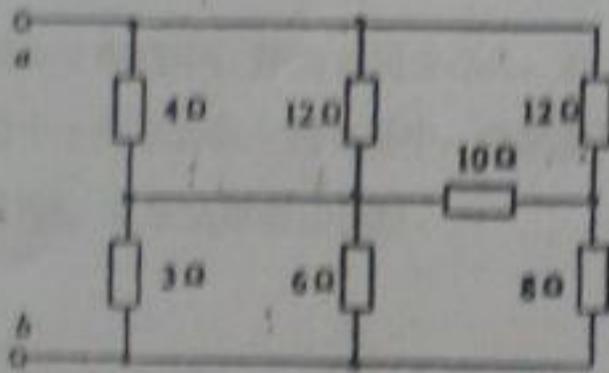

图 1-1

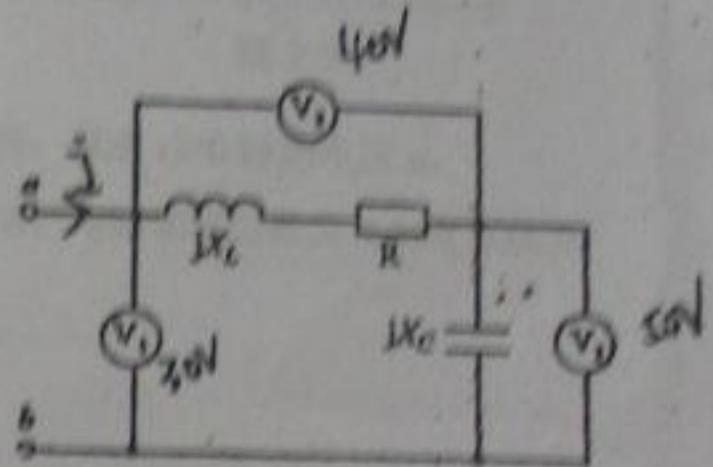

图 1-2

1-2 图 1-2 所示正弦稳态电路中, 电压表 1 的读数为 30V, 电压表 2 的读数为 40V, 电压表 3 的读数为 50V。试求正弦稳态电路的功率因数。

1-3 电阻电路如图 1-3, 试求支路电压 u_x 。

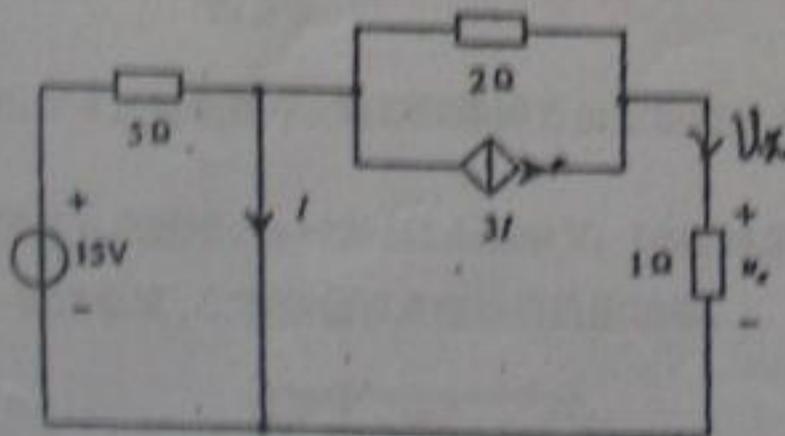

图 1-3

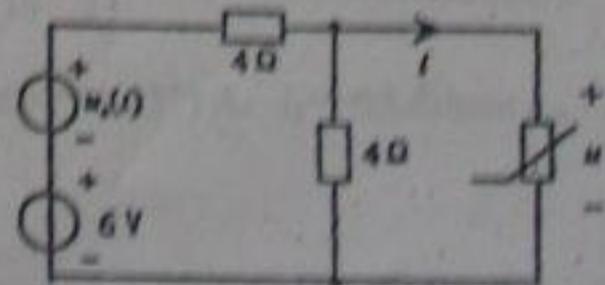

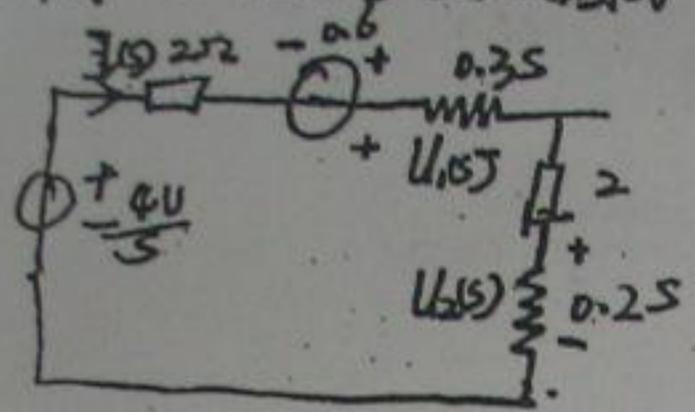

图 1-4

1-4 图 1-4 所示非线性电路中, 已知非线性电阻的伏安特性为 $u_x = i^2$ ($i > 0A$), 小信号电压 $u_x(t) = 160 \cos 314t$ mV, 试用小信号分析方法求电流 i 。

解: 由圖知 $i_{L1}(0_-) = \frac{4}{2} = 2A$, $i_{L2}(0_-) = 0$
 原圖 → 拉氏域等效圖 $Li_{L1} = 0.3 \times 2 = 0.6V$

$$\therefore \frac{4}{s} = I(s) \cdot [2 + 0.3S + 0.2S] \rightarrow 0.6 = I(s) \cdot (2 + 0.5S) - 0.6$$

$$\therefore I(s) = \frac{1.2 + 0.6S}{(2 + 0.5S)S}$$

$$U_1(s) = 0.3S \cdot I(s) = \frac{0.3S \cdot (1.2 + 0.6S)}{(2 + 0.5S)S} = \frac{(1.2 + 0.18S) \times 0.3}{2 + 0.5S} = 0.36 + \dots$$

$$U_2(s) = 0.2S \cdot I(s) = \frac{0.2S \cdot (1.2 + 0.6S)}{(2 + 0.5S)S} = \frac{(0.24 + 0.12S) \times 0.2}{2 + 0.5S} = 0.24 + \dots$$

$\sqrt{\frac{1}{2}} D(s) = 2 + 0.5s^2$, $\sqrt{\frac{1}{2}} D(s) = 0$, $P_1 = 0$, $P_2 = -4$

$$K_1 = \frac{N(s)}{D'(s)} = \frac{1.2 + 0.18s}{2 + s} \Big|_{s=0} = 2$$

$$K_2 = \frac{N(s)}{D'(s)} = \frac{1.2 + 0.18s}{2 + s} \Big|_{s=-4} = -0.8$$

$$i(t) = 2 - 0.8e^{-4t}$$

$$U_1(s) = 0.36 + \frac{0.96}{s+4}$$

$$U_2(s) = 0.24 + \frac{0.66}{s+4}$$

$$\therefore U_1(t) = 0.36 + 0.96e^{-4t}$$

$$U_2(t) = 0.24 + 0.66e^{-4t}$$

二、计算下列各题 (每小题 10 分, 共 50 分)

2-1 图 2-1 所示直流电路中, 当电流 $I_L = 2A$ 时, 负载电阻 R_L 消耗的功率最大, 试求 U_s 。

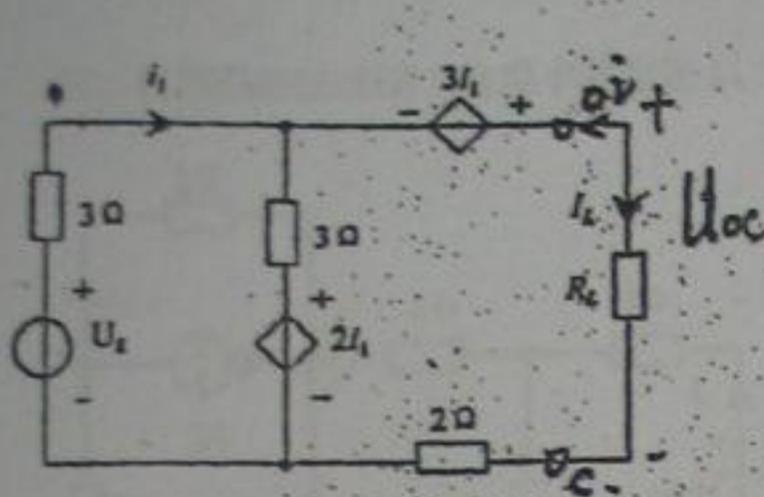

图 2-1

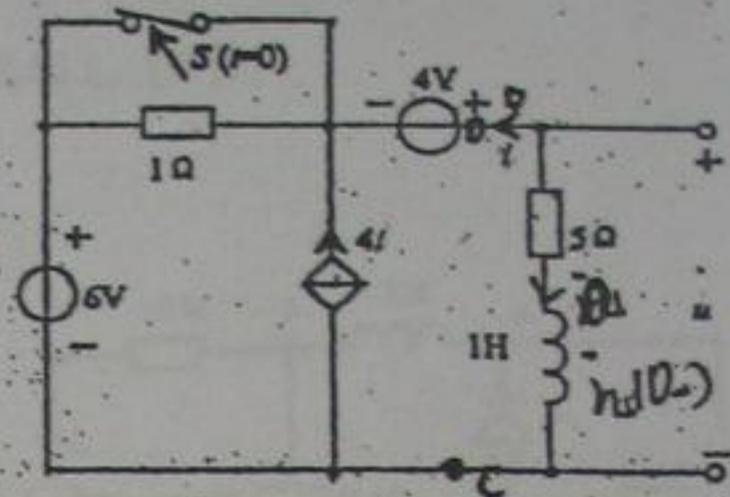

图 2-2

2-2 图 2-2 电路中, 开关 S 闭合已久, 在 $t=0$ 时 S 断开, 试求 $t \geq 0$ 时的电压 u 。

2-3 图 2-3 所示对称三相电路中, 负载消耗功率为 3kW, 电路功率因数为 0.866 (负载为感性), 试求功率表的读数。

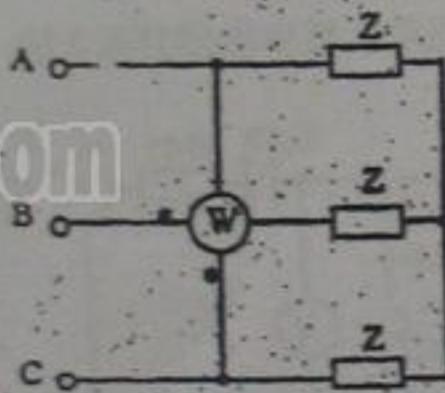

图 2-3

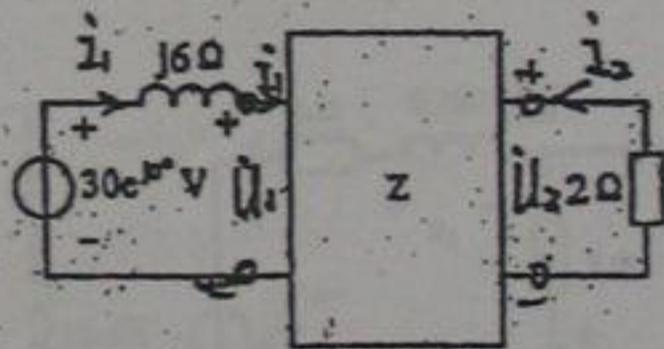

图 2-4

2-4 图 2-4 正弦电路中, 双口网络的 Z 参数矩阵为 $Z = \begin{bmatrix} 20 & 6 \\ 10 & 3 \end{bmatrix} \Omega$, 求电压源发出的功率。

2-5 图 2-5 电路中, $u = 12 + 141.4 \cos \omega t \text{ V}$, $i_1 = 4 + 28.28 \cos(\omega t - 53.13^\circ) \text{ A}$, $i_2 = -35.4 \sin \omega t \text{ A}$, 试求电流 i 的有效值以及电路消耗的功率。

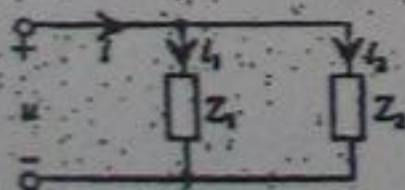

图 2-5

三、试用回路法求图 3 电路中的电流 i_1 、 i_2 和 i_3 。(18 分)

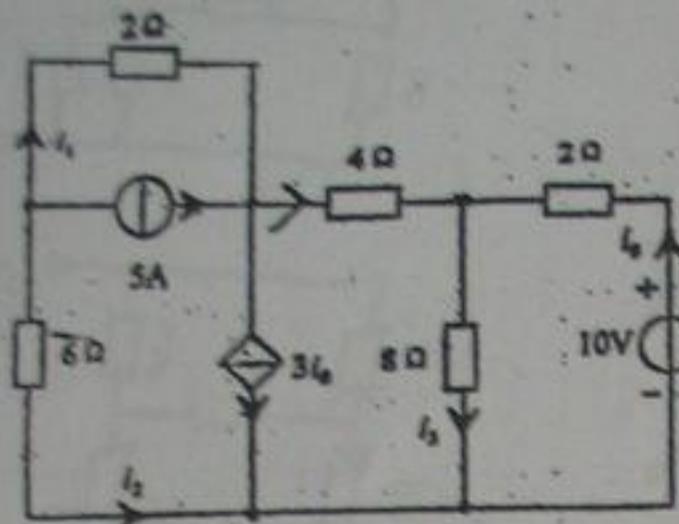

图 3

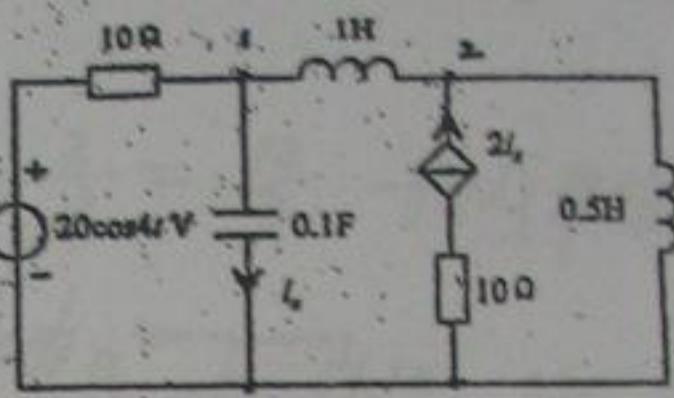

图 4

四、试用结点法求图 4 正弦稳态电路中的电流 i_2 。(16 分)

五、图 5 正弦稳态电路，电压表读数为 100V，功率表读数为 1000W，求电压 $u_1(t)$ 。(18 分)

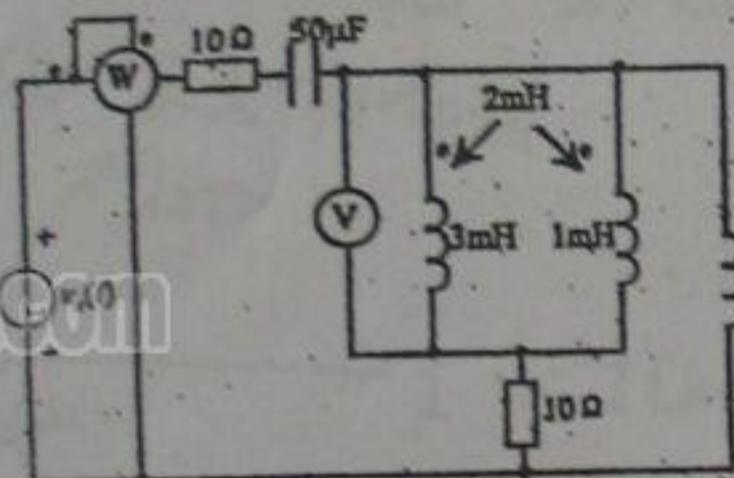

图 5

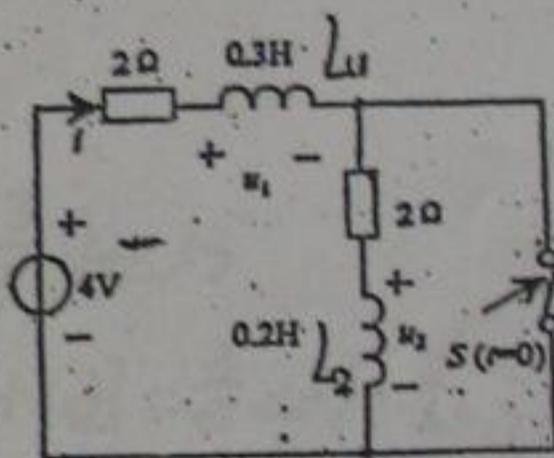

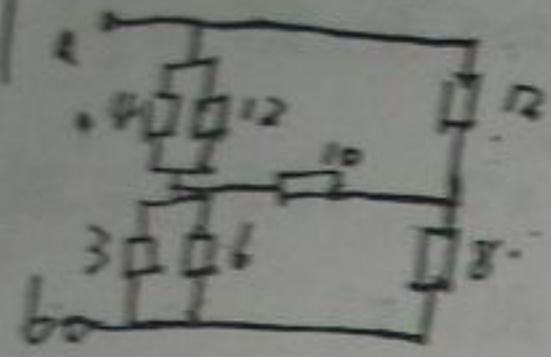

图 6

六、图 6 所示电路中，开关 S 在 $t=0$ 时打开，打开之前电路处于稳态，试用运算法求 $t \geq 0$ 时的电感电压 u_1 和 u_2 以及电路电流 i 。(16 分)

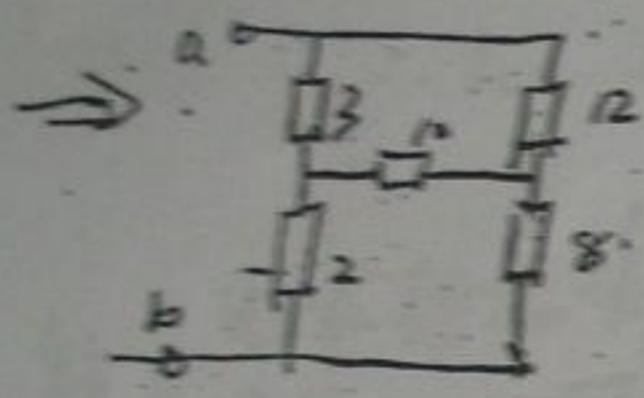

中南大学
2003年试题

1. 解: 原图可化为

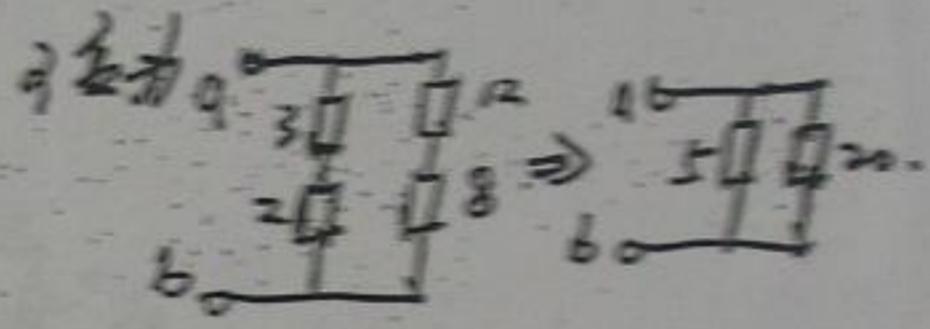

$$R_{ab} = \frac{4 \times 12}{4 + 12} = 3$$

$$R_2 = \frac{6 \times 3}{6 + 3} = 2$$

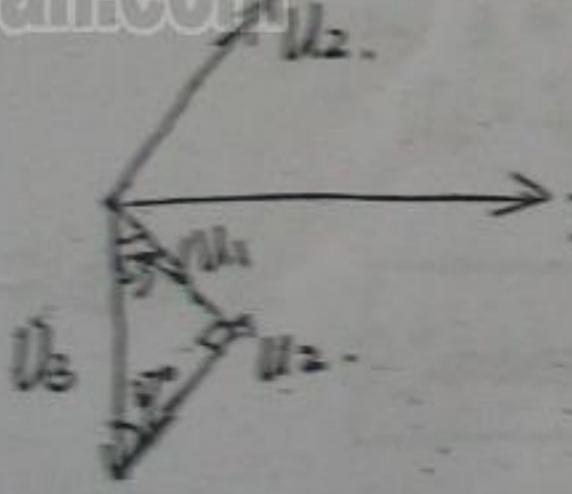

因为 $\frac{3}{2} = \frac{12}{8}$, 构成平衡电桥。

$$R_{ab} = \frac{5 \times 20}{5 + 20} = \frac{100}{25} = 4 \Omega$$

2. 解: 由题画出相量图。

$$\therefore U_1 = \frac{3}{5} U_3 \angle 53^\circ$$

$$\therefore i [R + j(\omega L + \omega C)] = \frac{3}{5} \angle 53^\circ \cdot i \cdot j \omega L$$

$$R + j(\omega L + \omega C) = \frac{3}{5} \cdot j \omega L (0.6 + j0.8)$$

$$R + j(\omega L + \omega C) = j0.36 \omega L - 0.48 \omega L$$

$$\therefore \text{有 } \begin{cases} R = -0.12 \omega L \\ \omega L + \omega C = 0.36 \omega L \end{cases}$$

$$\omega L + \omega C = 0.36 \omega L$$

$$\therefore \text{功率因数 } \lambda = \cos \varphi = \frac{R}{\sqrt{R^2 + (\omega L + \omega C)^2}} = \frac{-0.12 \omega L}{\sqrt{(-0.12 \omega L)^2 + (0.24 \omega L)^2}}$$

$$= \frac{-0.12 \omega L}{0.24 \omega L} = 0.5$$

解: 由图可知, 流过 1Ω 电阻的电流为 $\frac{U_x}{1} = U_x \text{ A}$.

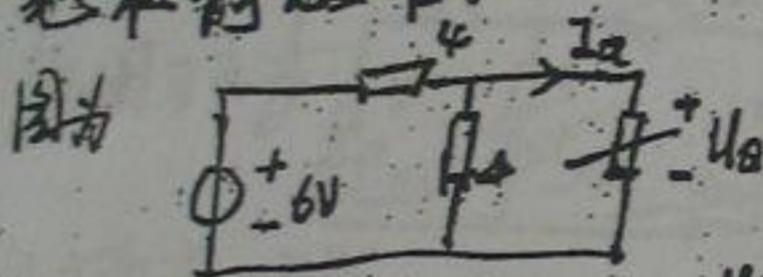

所以流过 2Ω 电阻的电流为 $U_x - 3\text{I}$

所以流过 5Ω 电阻的电流为 $U_x + \text{I}$

故可列方程:
$$\begin{cases} 15 = 5 \times (U_x + \text{I}) \\ 2 \times (U_x - 3\text{I}) + U_x = 0 \end{cases} \Rightarrow 3U_x = 6$$

$$\therefore U_x = 2\text{V}$$

解: 先求静态值.

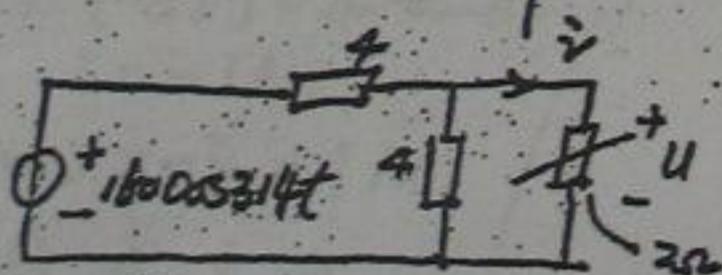

列方程 $6 = 4 \times (I_0 + \frac{U_0}{4}) + U_0$.

$3 = 2I_0 + U_0$.

$\therefore U_0 = 3 - 2I_0$ 代入解得: $I_{01} = 1\text{A}$ 或 $I_{02} = -3\text{A}$ (舍去)

动态图为:

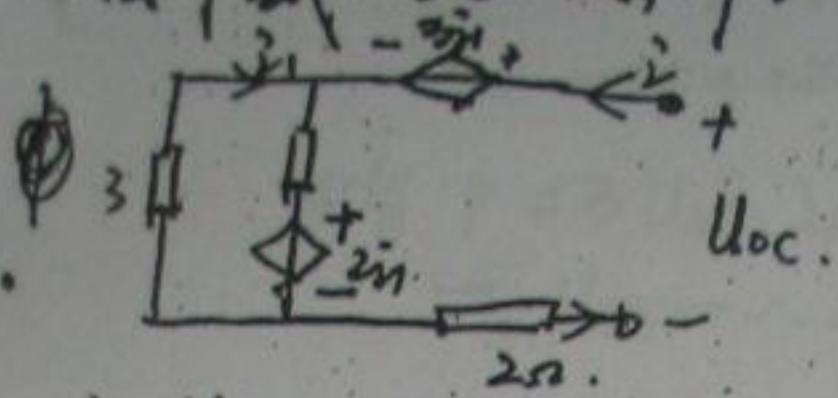

$U = i^2 R_d \Rightarrow R_d = \frac{dU}{di} = 2i \Big|_{i=i_0} = 2\Omega$

$$U = \frac{4 \times 2}{4 + \frac{4 \times 2}{4+2}} \times 160 \cos 314t = \frac{1}{4} \times 160 \cos 314t = 40 \cos 314t$$

$$i_x = \frac{U}{R_d} = 20 \cos 314t$$

$$i = i_x + i_0 = 1 + 20 \cos 314t$$

解：原图作戴维宁等效，即为

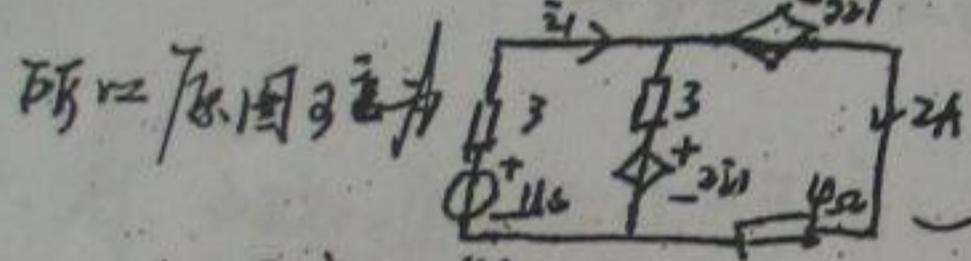

$$\begin{aligned} \therefore U_s &= 3i_1 - 3i_1 + 2 \times 4 = 8 \\ \therefore U_s &= 8V \end{aligned}$$

$$\therefore U_{oc} = 3i_1 - 3i_1 + 2i_1$$

$$\therefore R_{eq} = \frac{U_{oc}}{i} = 2\Omega$$

当 $I_L = 2A$ 时 R_L 消耗功率最大

此时应有 $R_L = R_{eq} = 2\Omega$

2. 解：由三要素法得 $i(0_-) = \frac{10}{5} = 2A = i_L(0_-)$

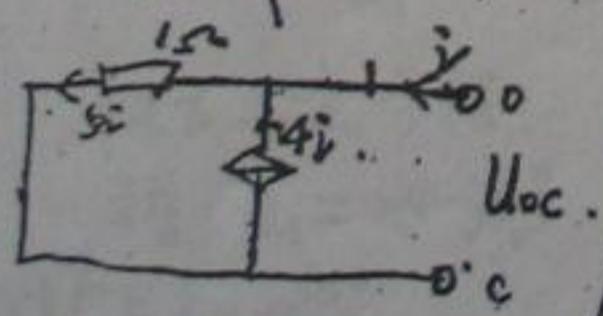

S 打开后，稳定后有

$$6 = 1 \times (-5i) - 4 \times (-5i)$$

$$\therefore i = -1A$$

$$\text{又 } i_L(\infty) = -i = 1A$$

原图作戴维宁等效

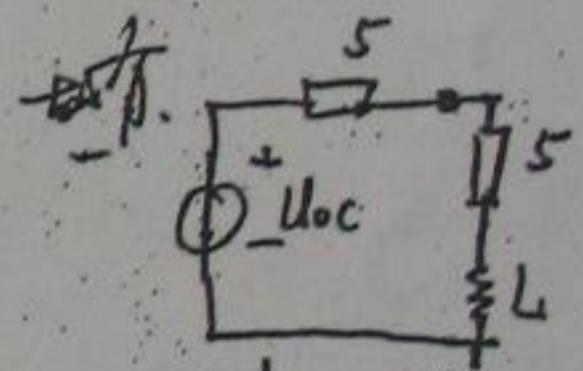

$$\therefore U_{oc} = 5i \times 1$$

$$\therefore \frac{U_{oc}}{i} = 5 = R_{eq}$$

$$i_{sc} = 2$$

$$\therefore U_{oc} = R_{eq} \cdot i_{sc} = 10V$$

$$\tau = \frac{L}{R} = \frac{1}{10}$$

$$\begin{aligned} \therefore i_L(t) &= i_L(\infty) + [i_L(0_+) - i_L(\infty)]e^{-t/\tau} \\ &= 1 + (2 - 1)e^{-10t} \\ &= 1 + e^{-10t} \end{aligned}$$

~~$$u = L \frac{di_L}{dt} = 10(1 - 10)e^{-10t} = -10e^{-10t}$$~~

$$\begin{aligned} \therefore u &= 5 + 5e^{-10t} + L \frac{di_L}{dt} \\ &= 5 + 5e^{-10t} - 10e^{-10t} \\ &= 5 - 5e^{-10t} (V) \end{aligned}$$

2-3. 解: 由已知功率表读数 $P = \operatorname{Re}[U_{BA} \cdot i_B^*] = U_{BA} \cdot I_B \cos(\varphi - 30^\circ)$
 又 $\cos \varphi = 0.866 \therefore \varphi = 30^\circ$.

且有 $P = 3 U_{AN} \cdot I_A \cdot \cos \varphi$.

~~$I_B U_{BA} = 3 \times 10^3 = 3 \times U_{AN} \cdot I_A \cdot \frac{\sqrt{3}}{2}$~~

$\therefore U_{AN} \cdot I_A = \frac{2000}{\sqrt{3}}$

$\therefore U_{BA} \cdot I_A = \sqrt{3} U_{AN} \cdot I_A = 2000$

$\therefore P = U_{BA} \cdot I_A \cdot \cos(30^\circ - 30^\circ) = 2000 \text{ W}$.

\therefore 功率表之读数为 2000W.

4. 解: 由已知 $\begin{cases} U_1 = Z_{11} \cdot I_1 + Z_{12} \cdot I_2 \\ U_2 = Z_{21} \cdot I_1 + Z_{22} \cdot I_2 \end{cases}$

由已知 $Z = \begin{bmatrix} 20 & 6 \\ 10 & 3 \end{bmatrix} \Omega$.

$\begin{cases} U_1 = 20 I_1 + 6 I_2 \\ U_2 = 10 I_1 + 3 I_2 \end{cases}$

由图可知 $30 = I_1 j 6 + U_1$

$U_2 = -2 I_2$

联立上述方程.

得 $I_1 = 2.4 - j 0.8$

$\therefore U = 30 e^{j 0^\circ} \text{ V}$

\therefore 电压源发出功率 $S = 30 \cdot I_1^* = 30 \times (2.4 - j 0.8) = 72 - j 24 \text{ VA}$
 $30 \times 2.4 = 72 \text{ W}$.

$$\begin{aligned}
 5. \text{ 解: 由图知 } \dot{i} &= \dot{i}_1 + \dot{i}_2 = 4 + 20\sqrt{2} \cos(\omega t - 53.13^\circ) - 35.4 \sin \omega t \\
 &= 4 + 20\sqrt{2} [\cos \omega t \cdot \cos 53.13^\circ + \sin \omega t \cdot \sin 53.13^\circ] - 4 \\
 &= 4 + 20\sqrt{2} (0.6 \cos \omega t + 0.8 \sin \omega t) - 35.4 \sin \omega t \\
 &= 4 + 16.968 \cos \omega t + 22.624 \sin \omega t - 35.4 \sin \omega t \\
 &= 4 + 16.968 \cos \omega t - 12.8 \sin \omega t \\
 &= 4 + \sqrt{16.968^2 + 12.8^2} \cos(\omega t + 37^\circ) \\
 &= 4 + 21.25 \cos(\omega t + 37.03^\circ)
 \end{aligned}$$

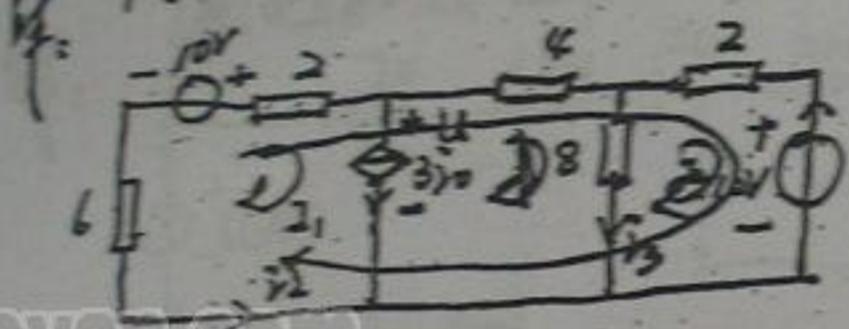

$$\therefore I = \sqrt{4^2 + \frac{21.25^2}{2}} = \sqrt{244.875} = 15.55 \text{ A}$$

电路消耗功率 $P_1 = UI_1 = 12 \times 4 = 48 \text{ W}$

又 $R = \frac{12}{4} \Omega$, \therefore 由 i_2 求 $I_2 = \frac{35.4}{\sqrt{2}} = 20 \text{ A}$

$P_2 = 20^2 \times 3 = 1200 \text{ W}$, $\therefore P = P_1 + P_2 = 1248 \text{ W}$

原电路可变为

$$(6+2)\dot{i}_2 = 10 - 11$$

$$\begin{cases}
 (2+4+2+6)I_1 + 2I_2 = 10 - 10 \\
 2I_1 + (4+2)I_2 = -10
 \end{cases}$$

解之得 $I_1 = \frac{5}{34}$, $I_2 = -\frac{35}{34}$

$$\dot{i}_2 = -I_1 = -\frac{5}{34} \text{ A}$$

$$\dot{i}_3 = -I_2 = \frac{35}{34} \text{ A}$$

由原图可得

$$\dot{i}_1 + 5 = \dot{i}_2 + \dot{i}_3 - \dot{i}_0$$

$$\therefore \dot{i}_1 = 2\dot{i}_2 + \dot{i}_3 - 5$$

$$\text{又 } \dot{i}_0 = -(2\dot{i}_1 + \dot{i}_2) = \frac{30}{34} = \frac{15}{17}$$

$$\therefore \dot{i}_1 = \frac{10}{17} + \frac{35}{34} - 5 = \frac{115}{34} \text{ A}$$

解: 由节点法列方程组

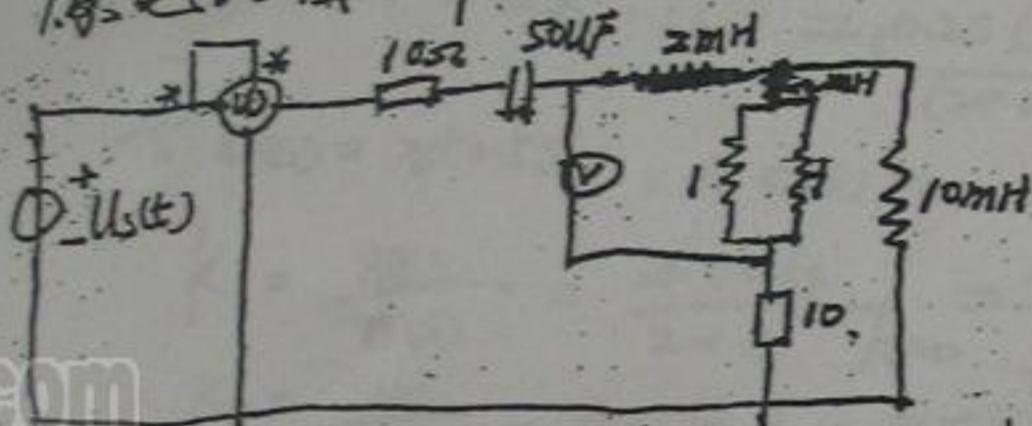

$$\begin{cases} (\frac{1}{10} + j\omega C + \frac{1}{j\omega L_1})U_{n1} - \frac{1}{j\omega L_1}U_{n2} = \frac{20}{10} \\ -\frac{1}{j\omega L_1}U_{n1} + (\frac{1}{j\omega L_1} + \frac{1}{j\omega L_2})U_{n2} = 2\dot{i}_x \end{cases}$$

且有 $U_{n1} = \dot{i}_x \cdot \frac{1}{j\omega C}$

联立解方程可得 $U_{n2} = 5\dot{i}_x, U_{n1} = \frac{60}{3-j}$

$$\begin{aligned} \therefore \dot{i}_x &= j\omega C U_{n1} = j \times 4 \times 0.1 \times \frac{60}{3-j} = \frac{j \times 24 \cdot (3+j)}{10} \\ &= -2.4 + j7.2 \end{aligned}$$

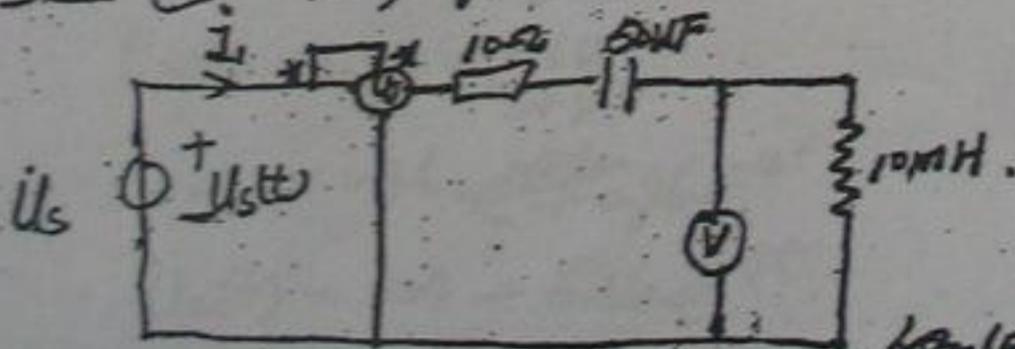

解: 原电路图在频域可得

很显然, 1 mH 与 -1 mH 发生并联谐振

$$\text{Im}[Y(j\omega)] = 0$$

上述电路图可简化为

由已知 $P = \text{Re}[U_s \dot{I}_1] = 1000 = U_s \cdot I_1 \cdot \cos(\varphi = 0^\circ)$ $P = I_1^2 R = 1000$

$$U_s = I_1 \cdot (10 + \frac{10}{j\omega C}) \quad \therefore I_1^2 = 100$$

$$\text{又 } I_1 \cdot \omega L = 100 \quad \therefore \omega L = \frac{10}{10} \quad \therefore \omega = 1000$$

$$\text{又 } \varphi = 10 + j\omega L + \frac{1}{j\omega C} = 10 - j10 \quad \therefore \varphi = -45^\circ$$

$$\therefore U_s = |Z| \cdot I_1 = 10\sqrt{2} \times 10 = 100\sqrt{2} \quad \therefore U_s(t) = 200 \cos(1000t - 45^\circ)$$
